## MINISTRY OF CIVIL AVIATION

(COMMISSION OF RAILWAY SAFETY)

पूर्वोत्तर रेलवे, मं.रे.प्र. कार्यालयं परिसर 16, अशोक मार्ग, लखनऊ-226001 N.E. Railway, DRM OFFICE CAMPUS 16, Ashok Marg, Lucknow-226 001

संख्या-एम.15013/1/2017-18-त.वि.(पार्ट-II)

दिनांक:07.06.2018

सेवा में.

प्रधान कार्यकारी निदेशक (संरक्षा) रेल मंत्रालय (रेलवे बोर्ड) रेल भवन नई दिल्ली

विषय:—Revision and Standardization of Observation/Measurement Proforma for Accident Investigation/Enquiry.

संदर्भः-(i) RDSO's Letter No. CT/Safety, Dated 18.08.2017

- (ii) This office's Letter no. M.15013/1/2017-2018-T.W., Dated 19.08.2017
- (iii) Railway Board's Letter No. 2009/Safety(A&R)/1/1, Dated 28.12.2017
- (iv) RDSO's Letter No. CT/Safety, Dated 09.05.2018

Vide above reference (i) letter, RDSO had prepared a draft proforma containing exhaustive observations/measurements to be done during accident investigation related to all the departments after some interactions and consultation with the Commission. This draft proforma, vide above reference (ii), was sent by this office to Railway Board for due deliberation and uniform adoption on Indian Railways.

Railway Board, vide above reference (iii), sent the subject proforma back to RDSO with the direction to concerned departments to deliberate in detail on the comments offered by Civil and Mechanical Engineering Directorates of Railway Board on the proposed draft proforma and to send it back with revisions to Railway Board after consultation with Chief Commissioner of Railway Safety (CCRS).

RDSO after incorporating the necessary amendments, in the new revised proforma, has sent the draft to Commission for forwarding it to Railway Board. This office has examined the new revised proforma vis-à-vis earlier proforma sent by this office to Railway Board vide letter under reference (ii). Soft copy of the revised proforma has been sent on 07.06.2018 on e-mail id kumar.vinod1@gov.in.

In view of the aforesaid, it is suggested that revised proforma on the subject matter may be considered for uniform adoption on Indian Railways by Railway Board. In the interim period, till the revised proforma is issued by the Ministry of Railways, the Commission shall follow this new

revised proposed proforms for observations/measurments during accident investigation/inquiry. However, depending upon site conditions, if the need is felt for additional measurements, the same shall be advised by the Commissioners on case to case basis.

Communication regarding approval of the proforma by the Railway Board along with one copy of the 'approved proforma' may kindly be sent to this office.

(उत्तम प्रकाश) उप रेल संस्था आयुक्त (यांत्रिक) कृते मुख्य रेल संस्था आयुक्त

प्रतिलिपि -

महानिदेशक / अनुसंधान, अभिकल्प एवं मानक संगठन, मानक नगर, लखनऊ-226001-को उनके पत्र संख्या. CT/Safety, Dated 09.05.2018 के संदर्भ में सूचनार्थ। Soft copy of the Revised proforma as mentioned above has been sent on e-mail-secydg@gmail.com on 07.06.2018.

#### **General Guidelines**

- 1. Careful observation of clues and a comprehensive record thereof is vital for accident enquiry. In addition, a comprehensive record of track and rolling stock parameters and operating features is required for investigation of derailments.
- 2. There are two broad categories of derailment

Sudden derailment caused by wheelset jumping of the rails. Such a derailment indicates that the derailing forces were high enough to suddenly force the wheel off the rail. These are typically caused by failure of vehicle/ track components, obstruction on track, entanglement of hanging parts of rolling stock etc. These derailments are characterized by a short mark on rail table between Point of Mount and Point of Drop. In some cases the Point of Mount may even be absent.

Derailment by flange climbing, caused by wheel mounting the rail in a relatively gradual manner. It indicates that the derailing forces were powerful enough to overcome the normal stabilizing forces, yet not sufficient to cause a sudden derailment. Such derailments are characterized by a longer mark on the rail table between Point of Mount and Point of Drop. Track and rolling sock parameters and operating features influence the rail-wheel interaction forces and, hence, their complete record and a comprehensive analysis is required to arrive at the mechanism of derailment. Cause and consequence of derailment are required to be differentiated through this comprehensive analysis.

- 3. Locating and examining the wheel mounting mark(s) at the initial point of derailment is very important for identifying the category of derailment. Precise measurements and critical and detailed examination of the wheel mounting marks should be made e.g. their length, strong or faint, broken or continuous, single or multiple, etc. Photographs should be taken of such marks, not only on the rail, but also on the fastenings, sleepers and ballast.
- 4. Derailment proneness increases with increased Lateral wheel force, reduced Vertical wheel load (Off loading) and increased Positive Angularity of wheel. Derailment proneness becomes substantially higher in case of axle moving with a persistently positive angularity. Track and rolling stock parameters and operating features should be critically analyzed for their contribution towards these causes. In case of derailments in curve, proper functioning of Bogie rotation system to ensure undue angularity needs close examination. Contribution of track twist and spring defects and twist in bogie frame/ vehicle under frame to derailments caused by wheel Off loading needs to be analyzed. In case of derailments at high speed, parameters affecting vehicle oscillation and damping thereof needs a close analysis.

- 5. While analysing the mechanism of derailment, relative contribution of track and rolling stock parameters to the rail-wheel interaction forces needs a comprehensive analysis. Reference should be made to the safety limits/ Maintenance limits specified in IRPWM/ IRCA Rules/ Maintenance Manuals.
- 6. Proforma for measurement of locomotive, wagon, and carriage are attached as annexure-A, B and C respectively for recording the details. The joint measurement to be submitted by senior supervisors shall not be complete till all the measurement of rolling stock and track as per enclosed proforma have been recorded. Only completed joint measurement w.r.t. rolling stock and track shall become a document to be relied upon by the enquiry committee for drawing conclusion regarding cause of accident.
- 7. No enquiry shall be completed before the complete measurement of rolling stock and track is available and made part of the enquiry report. President of the Enquiry Committee may get additional measurements done as per requirement of the derailment case.
- 8. The photographs of the concerned sections of track and part of rolling stocks shall be taken and annexed in the enquiry report. ART personnel should be trained for identifying such relevant part of track and rolling stocks involve in the accident.
- 9. In case of derailment of passenger trains causing injury to passengers, video recording of the concerned part of track and rolling stock shall be carried out by nominated ART personnel, trained for the purpose.
  - Photography & videography of accident site shall be with great care & precision, similar to a crime scene photography/videography. ART personnel nominated for this shall be suitably trained for the purpose. The photographs, videos should be self explanatory such that relevant conclusion can be drawn.
- 10. Site sketch of the derailment/accident location shall be prepared giving due care that all the relevant items are included along with the dimensions. A sample sketch is attached for the guidance.
  - Preservation of relevant clues, documents& photographs/videography of the accident scene shall be done under supervision of Sr. DSO of the Division. Measurement shall be taken at least for 100m in rear of the point of Mount/Drop.
- 11. M&C report from RDSO must also be part of accident enquiry report in case of a rail fracture.
- 12. In case of a suspected sabotage, Tell-tale sign must be preserved and recorded.

13. If rail/weld failure is suspected to be cause of derailment, assessment of impact loading to which the rail/weld was subjected to prior to its failure becomes important. In such cases, WILD data for few preceding trains shall be analyzed for critical alarms and any critical alarm shall be brought out and deliberated by enquiry committee.

### **Proforma for Motive Power (Diesel & Electric)**

Locomotive (Diesel & Electric): Proforma to be filled in case of accident /derailment when loco is involved in accident

1. Basic information:a. Date of Accident:b. Train No. :c. Loco Class:

d. Loco Number:

Horn

Brake System

3. Check & record the observations as follows:

(a) Position of control handles, cutout cocks etc after the accident.

(b) Functioning of brake synchronizing valve-whether working or not.

(c) Position of brake blocks after the accident- whether applied or not.

f. Base Shed of Loco:

g. Date & Place last POH:

e. Loco manufacture year and place:

h. Kilometres earned after last POH:

i. Date & place of last major inspection:j. Date & place of last schedule inspection:

k. Whether any schedule is overdu	ne?:	
2. Give brief particulars of the safe	ty items not provided or provide	ed but missing/not working
Whether Loco is provided with:		
Safety fittings	Provided	Working
Headlight		
Speedometer		
Speed Recorder		
Flasher light '		

- (d) Condition of cattle guard.
- (e) Any sign of seizure of roller bearing in Axle box including condition of its components
- (f) Condition of Pivot and Side Bearer arrangement of bogie including obstruction to Bogie rotation.
- (g) Condition of Friction Damper components/ Hydraulic Dampers
- (h) Condition of Traction Rod/ Guide Rod including its connection.
- (i) Condition of Traction Link including its connection.
- (j) Condition of Lateral Stop components between Bogie and Loco body underframe
- (k) Any other observation in respect to mechanical defect of the locomotive, which might have any bearing on safe running of loco.

Note: Defective or broken material should be sent to CMT for testing, if necessary.

		6			

Measurement for Wheels for All Classes of Locomotives with wheel gauge (04 locations applicable for Bo-Bo Locos) (Continued)

#### Notes:

- 1. Wheel number one is the outer end axle of truck under the short hood and wheel count increases towards the Long hood on diesel loco, whereas for Electric Loco, wheel number one is the outer end axle under Cab-1(Cab- 1 is that side of the loco which has the compressors and Cab-2 is that side of the *loco* which has the ARNO convertor) and wheel count increases towards the Cab-2.
- The measurements of wheels are to be done using *wheel* gauges to RDSO drawing No.SKDL-3592 for all BG locomotives except WAP5 locos. For WAP5 locos RDSO's drawing No. SKOL-4446 and SKDL-4447 may be followed.
- 3 All measurements are to be taken on a level, un-canted track at the nearest yard.
- 4 Service limits given in the Maintenance Manual are for good maintenance practice and these are not safety limits. However, the measured values shall be compared with the service limits and degradation in values shall be discussed while finalizing the findings.

S.	Description	Obs	erved Value (in	Remarks
No.			mm)	
7.	Wheel gauge: For checking wheel gauge, three measurements at equal	1		All measurements shall be taken on a level tangent uncanted track. Information is
	spacing on the inner periphery of the two wheels on the same axle is to be	2		relevant in case of wheel disc shifting/bent axle only.
	recorded. Check for bent	3		For safety, similar limits as
	axle, if any.	4		applicable for track gauge are relevant for wheel gauge also.

## Proforma for Wagon

Note: Details regarding all derailed vehicles should be given except: -

- 1. (i) Where vehicles have derailed due to locomotive derailment
  - (ii) When the obvious and indisputable cause is sabotage or an obstruction on track
- 2. Front and rear and left (L) and right (R) are with respect to direction of movement.
- 3. For an obvious cause of derailment such as a broken axle, spring dropping off the run, and/or some part of under gear hanging loose and causing obstruction only relevant particulars need be filled.
- 4. Particulars for each derailing vehicle should be given in one sheet. Information against columns (5), (6), (8), (16), (17), (21), (22) should invariably be given for adjacent wagons on the same sheet.
- 5. Relevant details of adjacent vehicles should also be given if cause of derailment is not apparent.

Weight 52 Kg./ 90R/75 R etc. (Year of manufacturing and Cumulative GMT carried)	Condition of wear  (attach rail profile if wear is heavy)	GMT Carried	tie bars	Condition:	Condition: Hogged battered, low etc.	Staggered or square	Creep-Direction and extent of creep, type of creep anchors used with numbers per rail in the affected section
18	19	20	21	22	23	24	25

General remarks	Description of anti- sabotage measures like reverse jaws welded rails etc.	Location of points of mount		Location of points of derailment	
about cracks or fracture of fish- plates, fish bolts and other components		Whether on straight, curve or transition	Whether on a falling grade, level or rising grade and or on sag	Whether on straight, curve or transition	Whether on a falling grade, level or rising grade and or on sag
26	27	28	29	30	31

#### Note -

- (1) Left and right are with respect to direction of Train movement.
- (2) The data in Col. 2 to 26 need not be collected when the defect is obviously and indisputably on account of sabotage and/or obstruction on track.
- (3) Only broken track material which is not indisputably to be broken after the accident should be included in Col. 25 and should be preserved.
- (4) Col. 27 need be filled in only when there is a suspicion about sabotage being the cause of derailment.
- (5) Sag extends 90 metres on either side of theoretical junction of the grade lines Col. 29 and 31.

# Proforma for Track measurement

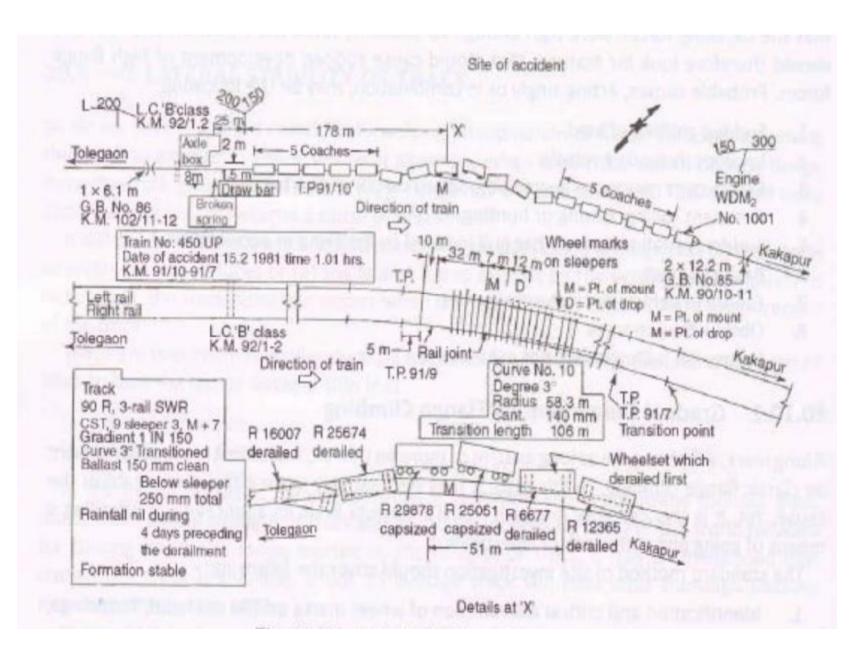

PART - B

Station No.	Distance apart (metres)	Gauge slack or tight from the Exact in loaded condition (mm)	Cross Level under <i>loaded</i> condition (mm)	Marks on sleepers or rail top	Grinding or rubbing marks on rails
1	2	3	4	5	6

Examination of	Subsidence of				
alignment	track	in loa	aded condition		
for perceptible kinds of track distortion in the vicinity of the point of derailment		On 20 M. or 10 M. chord depending on practice prevalent on the Railway for flat curves more than 600 M. radius	On 10 M. or such shorter chords as considered necessary for sharp curves (less than 600 M. radius on B. G. and M. G.)	Remarks regarding length of transition, degree of curve and specified superelevation general alignment etc.	Longitudinal level to be recorded in the case of M. G. and N. G. in case of sags and curves
7	8	9	10	11	12

#### Note -

- (i) The point of mount should be marked station No. 0 and the stations numbered serially as (+) for measurements ahead of site of derailment and (—) for measurements in rear.
- (ii) The cross level will be measured on the left rail only as determined from the direction of movement.
- (iii) Normally measurement will be taken at station 3 M. apart for a distance of 45 metres on either side of 0 station if the cause of derailment is indisputably known, otherwise they will be taken for a distance of 100 metres in rear and 45 metres ahead of zero station.
- (iv) Where necessary measurements for Col. 3, 4 and 5 may in addition be taken at individual sleepers.
- (v) This proforma need not be filled when the cause of derailment is obviously established as due to sabotage, obstruction on track, broken axle, and/or spring having fallen off prior to point of derailment.
- (vi) Longitudinal levels should be recorded for 300 metres on rear and 100 metres in front, in case of straights at the middle of each rail and at versine recording points on curves @ 20/10 M intervals.

TYPICAL SKETCH OF ACCIDENT SITE
